Steam

The official Steam client can be themed using the Noctalia color scheme through the built-in theme system.

This requires the open-source modding framework [Millennium](#) and takes advantage of the [Material Theme](#) to provide dynamic color integration.

Setup

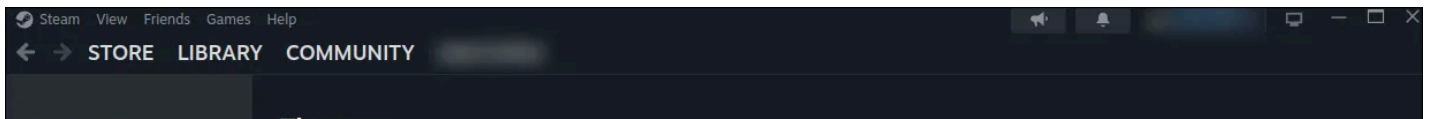

1. Enable Steam theming in Noctalia:

- Open **Settings → Color Scheme → Templates**
- Toggle on **Steam**

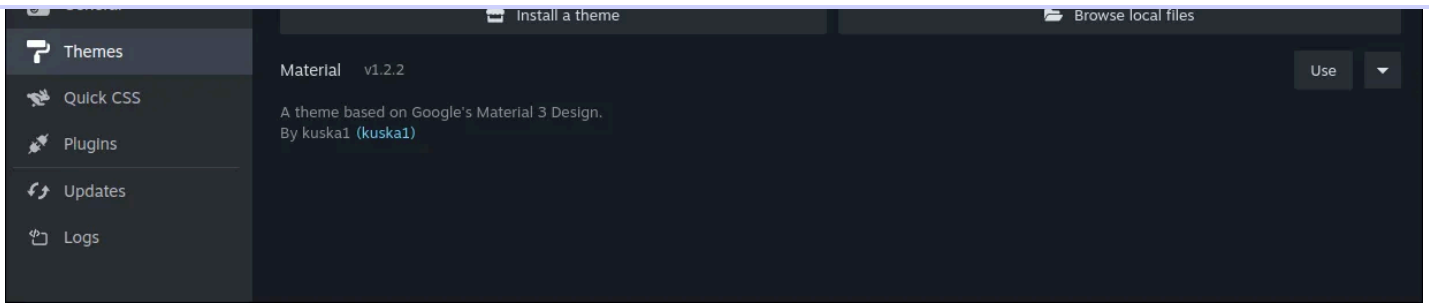

2. **Install Millennium:** you can find instructions for your distribution on [the installation page](#).

3. **Install Material-Theme:** copy the Theme ID from [the theme's page on steambrew.app](#), and install it in the Millennium Theme settings.

After that, you should see the theme installed but not enabled yet:

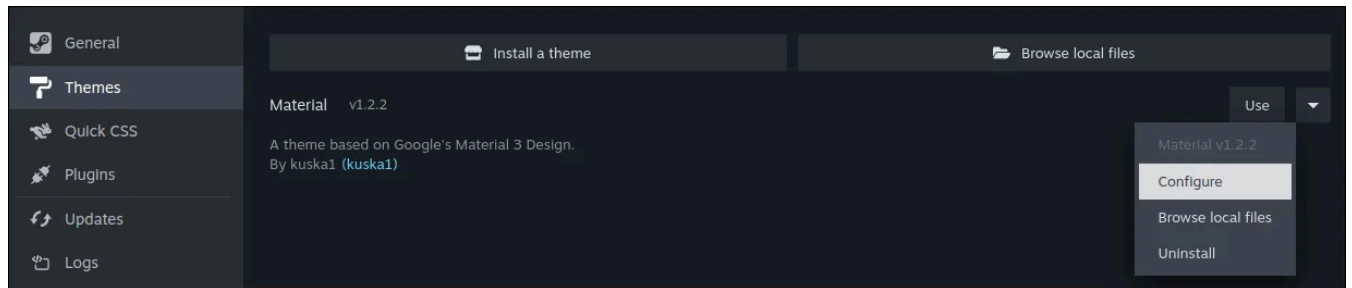

You are viewing the **v4 (stable)** documentation. [Switch to v5 \(alpha\) →](#)

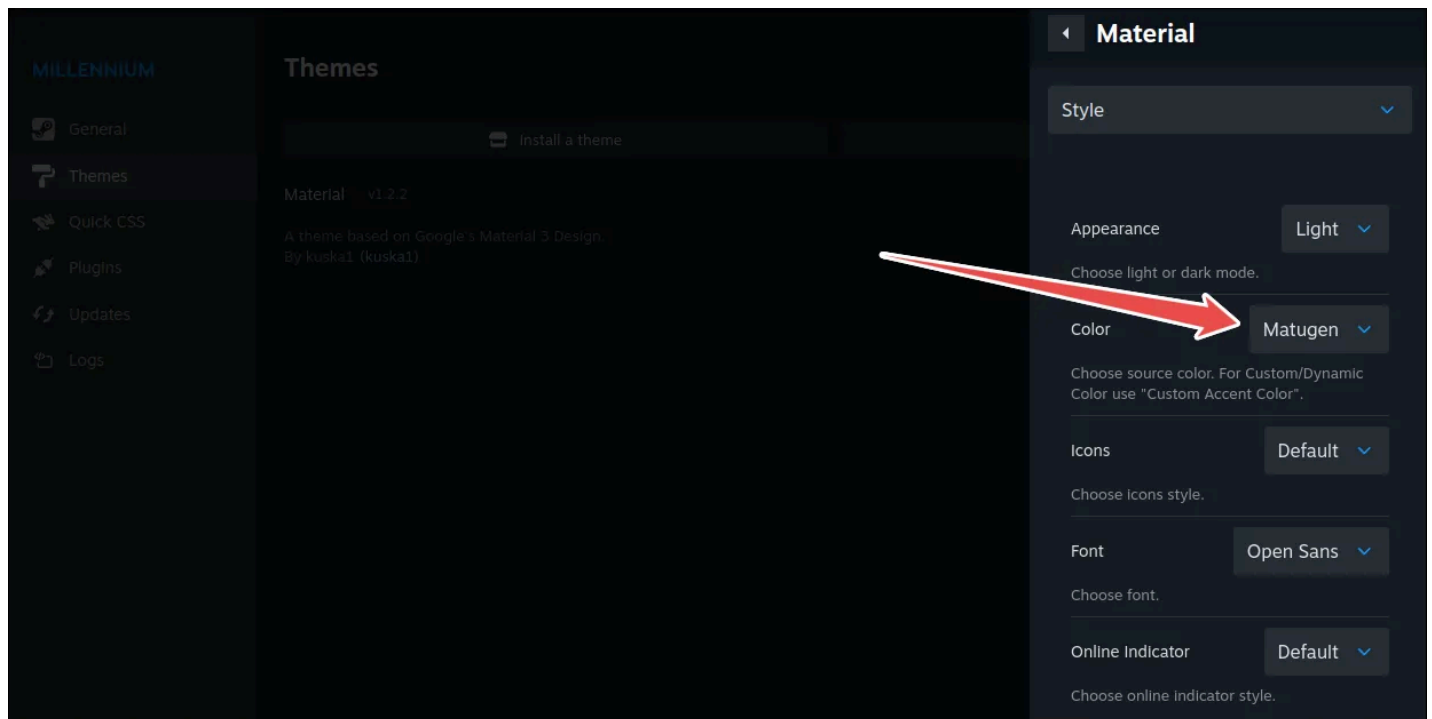

4. Enable the theme by clicking on the “Use” button.

5. Click on the drop-down on the right to configure the theme:

6. In the “Color” drop-down menu, make sure to select “Matugen”.

7. Regenerate a color scheme in Noctalia (for example, toggling dark-light mode, or changing the wallpaper), and restart Steam.

Troubleshooting

You are viewing the **v4 (stable)** documentation. [Switch to v5 \(alpha\) →](#)

- **Colors not updating:** Restart the Steam client fully (Steam menu > Exit) after installing the theme and toggling Matugen option. Also make sure Millennium is installed and running correctly.
- **Theme looks broken:** Ensure you're using the official Steam client and have the latest version of Millennium and Material-Theme.

Additional Notes

The theme will automatically update when you change color schemes in Noctalia.
