kde

Sets up a graphical desktop environment

Desktop

This module sets up the [KDE Plasma](#) Desktop environment.

Customisation

This service intentionally does not provide any settings or customisation options, as desktop preferences are highly subjective. Clan currently supports only this default desktop configuration. Any additional customisation can be done via the `extraModules` option. Furthermore, if you want to use a different desktop environment or compositor (e.g. Gnome or sway), we encourage you to build your own [Clan Service](#) or have a look at the [Community Services](#).

Example Usage

```
1 inventory = {
2   instances = {
3     kde = {
4
5       # Deploy on all machines
6       roles.default.tags.all = { };
7
8       # Or individual hosts
9       roles.default.machines.laptop = { };
10    };
11  };
```

```
12 };
```

Roles

The kde service has the following roles:

- default

The `default` role has no configuration

← Previous
importer
