importer

Convenient, structured module imports for hosts.

Utility

The importer module allows users to configure importing modules in a flexible and structured way. It exposes the `extraModules` functionality of the inventory, without any added configuration.

Usage

```
1 inventory.instances = {
2
3   zone1 = {
4     module.name = "importer";
5     roles.default.tags.zone1 = {};
6     roles.default.extraModules = [ modules/zone1.nix ];
7   };
8
9   base = {
10    module.name = "importer";
11    roles.default.tags.all = {};
12    roles.default.extraModules = [ modules/base.nix ];
13  };
14
15 };
```

This will import the module `modules/base.nix` to all machines that have the `all` tag, which by default is every machine managed by the clan. And also import for all machines tagged with `zone1` the module at `modules/zone1.nix`.

Roles

The importer service has the following roles:

- default

The `default` role has no configuration
