Niri

Add the following settings to your Niri configuration file (usually located at `~/.config/niri/config.kdl`).

These settings are for general window appearance and functionality.

```
window-rule {  
  // Rounded corners for a modern look.  
  geometry-corner-radius 20  
  
  // Clips window contents to the rounded corner boundaries.  
  clip-to-geometry true  
}  
  
debug {  
  // Allows notification actions and window activation from Noctalia.  
  honor-xdg-activation-with-invalid-serial  
}
```

Wallpapers setup

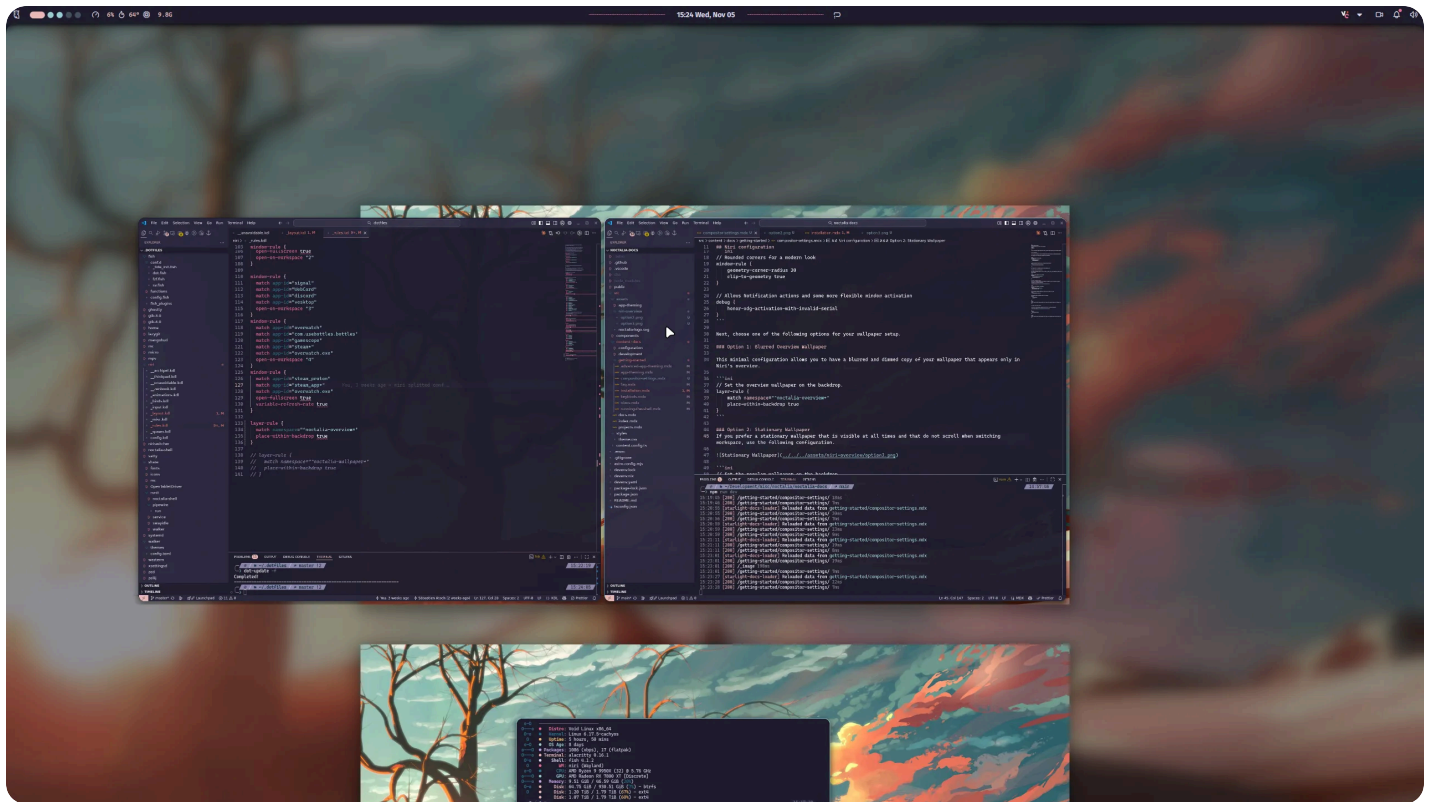

Next, choose one of the following options for your wallpaper and overview setup.

Note

The “backdrop” in Niri is a layer behind all workspaces that is visible when you trigger the overview mode.

Option 1: Blurred Overview Wallpaper

You are viewing the **v4 (stable)** documentation. [Switch to v5 \(alpha\) →](#)

Blurred Overview Wallpaper

```
// Set the overview wallpaper on the backdrop.
layer-rule {
    match namespace="^noctalia-overview*"
    place-within-backdrop true
}
```

Note

Option 1 requires "Enable overview wallpaper" to be turned ON in Noctalia's settings on the Wallpaper tab. It also uses more memory as it handles an extra wallpaper per monitor.

Option 2: Stationary Wallpaper

If you prefer a stationary wallpaper that is visible at all times and does not scroll when switching workspaces, use the following configuration.

You are viewing the **v4 (stable)** documentation. [Switch to v5 \(alpha\) →](#)

Stationary Wallpaper

```
// Set the regular wallpaper on the backdrop.
```

```
layer-rule {
  match namespace="^noctalia-wallpaper*"
  place-within-backdrop true
}
```

```
// Set transparent workspace background color so you see the backdrop at all times.
```

```
layout {
  background-color "transparent"
}
```

```
// Optionally, disable the workspace shadows in the overview.
```

```
overview {
  workspace-shadow {
    off
  }
}
```

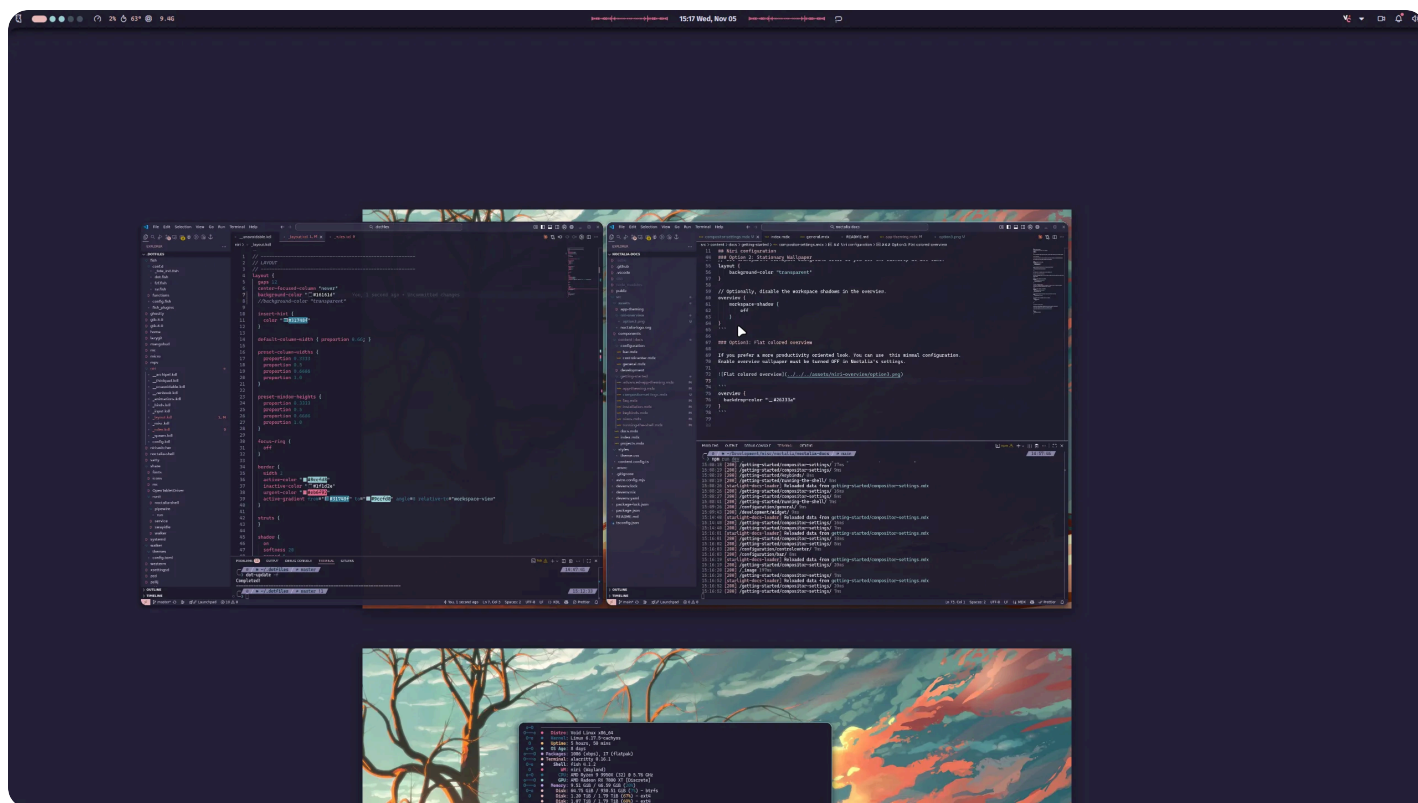

Note

the wallpaper tab.

Option 3: Flat Colored Overview

If you prefer a more productivity-oriented look, you can use this minimal configuration.

Flat colored overview

```
overview {  
    // Choose your favorite color.  
    backdrop-color "#26233a"  
}
```

Note

Option 3 requires “Enable overview wallpaper” to be turned OFF in Noctalia’s settings on the Wallpaper tab.

Blur

You are viewing the **v4 (stable)** documentation. [Switch to v5 \(alpha\) →](#)

Blur support was introduced in Niri version 26.04. Adding these rules to earlier versions of Niri will result in configuration errors.

You can enable blur behind windows and Noctalia's bar, panels, and dock.

```
/* Apps: blur them all without xray for a better look */
window-rule {
  background-effect {
    blur true
    xray false
  }
}

/* Noctalia: blur everywhere without xray for a better look */
layer-rule {
  match namespace="^noctalia-(background|launcher-overlay|dock)-.*$"
  background-effect {
    xray false
  }
}
```

You can also fine-tune the blur effect globally:

```
blur {
  passes 2    // more passes = stronger blur (default: 3)
  offset 3.0  // sample distance per pass (default: 3.0)
  noise 0.03  // grain overlay (default: 0.02)
  saturation 1.0 // color saturation boost (default: 1.5)
}
```

Fine-tuning the blur effect
